Synchronous Generator. Advantages: The power factor of synchronous generator can be adjusted. The application of a large synchronous generator can improve the operating efficiency when the speed regulation is not required. Disadvantage: The cost is higher than that of asynchronous generator. Application: Synchronous generator is mainly used in diesel generator set. Asynchronous generator

Generator cannot deliver power to electric power system unless its voltage, frequency and other parameters are exactly matched with the network. Synchronization is accomplished by controlling the exciter current and the engine speed of the generator.

Synchronization of Generators - Electronics Hub

Droop speed control is a control mode used for AC electrical power generators, whereby the power output of a generator reduces as the line frequency increases. It is commonly used as the speed control mode of the governor of a prime mover driving a synchronous generator connected to an electrical grid. It works by controlling the rate of power produced by the prime mover according to the grid frequency. With droop speed control, when the grid is operating at maximum operating frequency, the prim

Brushes are required in synchronous generator to supply DC voltage to the rotor for excitation. Diesel Generator Sets are generators that use diesel to run. These are commonly used as backup units for emergency power supply. They are available in both single and three-phase. Diesel engines in these gensets are sturdy and reliable.

Diesel engine and generator speed are synchronized. The crankshaft of DE is coupled to the rotor of the synchronous generator (SG). SG needs to rotate at its nominal speed to produce reliable electricity either in full load or low load. Thus, the DE, coupled with SG rotor, should inevitably rotate at SG's nominal speed.

In a synchronous generator, the waveform of generated voltage is synchronized with (directly corresponds to) the rotor speed. The frequency of output can be given as f = N * P / 120 Hz, where N is speed of the rotor in rpm and P is number of poles.
