Fingerprint genetics: The three major fingerprint groups represent a classic example of incomplete dominance.

Incomplete dominance occurs when neither the dominant nor recessive alleles for a trait act fully to create an intermediate phenotype. The dominant gene does not cover up the recessive gene, but instead their traits are blended together.

10-11 Online Activities

Students also mistakenly think that dominant/recessive relationships are the norm. This is largely because almost all the alleles they see in their genetics course are presented in dominant/recessive pairs, with alternatives presented only as variants of or exceptions to dominance ("codominance" and "incomplete dominance").
