Tabular models are created in Microsoft Visual Studio with the Analysis Services projects extension. The extension installs a tabular model designer, which provides a design surface for creating semantic model objects like tables, partitions, relationships, hierarchies, measures, and KPIs. Tabular models can be deployed to Power BI Premium, Azure Analysis Services, or an instance of SQL Server Analysis Services configured for Tabular server mode.

~~Tabular modeling overview — Analysis Services | Microsoft Docs~~

A table in the tabular model is usually loaded from a single table in a relational database or from the results of a SQL SELECTstatement. A table has a fixed number of columns that are defined at design time and can have a variable number of rows, depending on the amount of data that is loaded.

Tabular is a memory dependent solution. The more memory, the better performance. If you do not have enough memory, the Tabular model will simply fail. The CPU core speed is also very important for Tabular databases. If your database requires a lot of space (more than 5 terabytes), the Tabular model cannot be implemented and the only solution is the Multidimensional solution. In Tabular databases, the hard disks are not as important, but the amount of RAM and CPU speed is very important ...
